PhiliReady: Micro-Demand Forecaster for Relief Goods

Predicting relief demand before disasters strike

Presented By :
str(UPC)

Disaster Problem

- Philippines frequently experiences earthquakes and typhoons
- Relief demand is difficult to estimate before disasters
- Delays in supply distribution affect vulnerable communities

Limitations of Current Relief Systems

- Manual Demand Estimation
- Reactive Disaster Response
- Reliance on Historical Averages
- Shortages and Wasted Supplies

Disaster Occurs

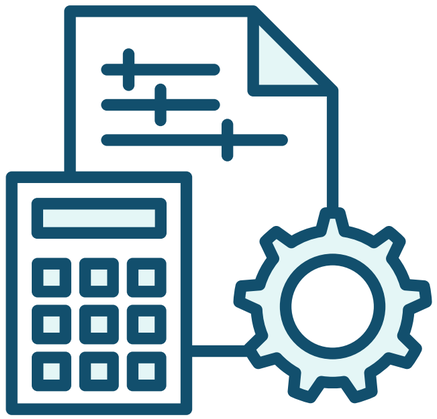
Micro-Demand Forecaster for Relief Goods

A decision-support system that estimates relief demand before disasters occur.



Estimate relief demand before disaster impact

Calculates supply needs per city

Supports proactive disaster planning

Helps LGUs allocate relief good efficiently

AI Integration

- Evaluates computed relief demand forecasts
- Detects potential risks such as shortages or oversupply of relief goods
- Generates simple recommendations for local authorities
- Helps disaster officers interpret forecast results through the dashboard
- Provides an AI chatbot that allows users to ask questions about forecasts, relief demand, and recommended actions

How the System Works?

Data Inputs

Risk Assessment

Demand Estimation

Relief Prediction

Dashboard

Prototype Demonstration

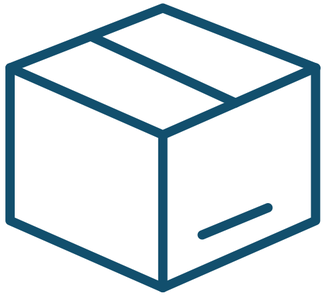
Data Protection and Ethical Use

- Uses aggregated city-level data
- No personally identifiable information collected
- Public datasets
- Responsible data use

Aligned with responsible data practices and privacy standards.

Impact on Disaster Response

Faster Planning



Better Allocation

Less Supply Waste

Faster Relief

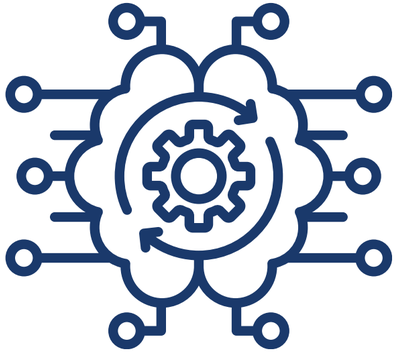
Supporting Sustainable Development Goals

Our solution contributes to global disaster resilience initiatives.

Future Development

Advanced AI Models

Expand AI beyond assessment



Machine learning demand prediction

Future Development

Regional Expansion

Philippines

Other ASEAN Member States

Future Development
